#### ABSTRACT

A quick, precise and accurate method based on HPTLC has been developed for analysis of Luliconazole. The method was developed and validated for the determination of Luliconazole on pre coated silica gel HPTLC plates using Toluene: methanol: GAA Solution (8:2:0.2V/V/V) as a mobile phase with Densitometric detection at 294nm. The method was validated for linearity, precision, accuracy and robustness. Linearity range for LUL was found 100-500ng/band Correlation coefficient was 0.990. The developed method was precise and robust, % RSD was found less than 2%. % recovery was found to be in range of 101.67-103.61%. LOD and LOQ were 15.48ng/b and 46.92ng/b. Stress degradation studies were performed to evaluate the stability indicating properties and specificity of the method. Degradation study was carried out by exposing of working standard solution of LUL with acid (0.1N HCL at 80°C), base (0.1 N NaOH at 80°C), hydrogen peroxide (3% H2O2), Distilled water (H2O) for 2 hours while one volumetric flask was exposed to UV light (294 nm) and one volumetric flask was exposed to (800 C) for 24 hours and thermal LUL sample at (80°C for 1hr) The degradation was found to be resp. (5.17%, 7.20%, 8.18%, 7.82%, 7.58%, 5.72%)

#### **KEYWORDS**

Analytical method validation, High-performance thin-layer chromatography, Luliconazole and Stability-indicating assay method.

#### **INTRODUCTION**

The drug Luliconaozole (LCZ) was selected for this study. The (2E)-2-[(4R)-4-(2, 4-dichlorophenyl)-1, 3-dithiolan-2-ylidene]-2-imidazol-1-ylacetonitrile, a completely unique antifungal drug launched in India by Ranbaxy Laboratories Ltd. The products were screened from active compounds associated with the drug luliconazole, a potent antidermatophytic

drug. LCZ possesses a good spectrum of antifungal is extremely potent and activity against dermatophytes [Uchida et al, 20041]. Till date no analytical method was reported for quantitative estimation of luliconazole [S. Sonawane et al, 2016<sup>2</sup>]. The present study was aimed to establish inherent stability of Luliconazole through stress induced studies under a variety of ICH recommended test conditions and to develop stability indicating HPTLC method Validation of the developed method was administered as per ICH guidelines. The developed method was applied to marketed lotion dosage forms. One of the available chromatographic techniques is HPTLC, which is employed for the identification of constituents, identification and determination of impurities and quantitative determination of active substances. HPTLC a crucial alternative method to HPLC or gas chromatography because the use of recent apparatus like video scanners, densitometers and new chromatographic chambers and simpler elution techniques, high-resolution particle size or chemically modified surface and development of computer programs for method optimization make HPTLC a crucial alternative method to HPLC or gas chromatography. Specifically, HPTLC is one among the perfect TLC technique for the analytical purposes due to its increased accuracy, reproducibility, and skill to document the results, compared with standard TLC. Because of this, HPTLC technologies are also the most appropriate TLC technique for conformity with GMPs. [Mahesh Attimarad *et al*,  $2011^3$ ].

#### **MATERIAL AND METHODS**

# High performance thin layer chromatography **CAMAG HPTLC SYSTEM** Make: Camag. Stationary Phase: Silica gel 60 F<sub>254</sub> plates Sample Applicator: Camag Linomat V Gas: Nitrogen Syringe: Camag 100µl syringe Development chamber: Camag twin trough glass chamber UV-Lamp: Camag (D2 and W) TLC Scanner: Camag TLC scanner III Available online: www.uptodateresearchpublication.com

**Software:** Win CAT's software

### **TLC Plates Used**

Aluminium plates precoated with silica gel 60 F254 plates (E. Merck, Darmstadt, Germany; supplied by Merck India, Mumbai, India).

## Sample applicator

Camag Linomat V (Muttenz, Switzerland). Pressure requirement for sample application is 3.5 bar. Dimension: 360mm x 510mm x 410mm (Width x Length x Height).

#### Syringe

Camag 100µl syringe (Hamilton, Bonaduz, Switzerland).

### **Development chamber**

Camag twin trough glass chamber (10 x 10cm and10 x 20cm)

### **UV-lamp**

It having the wavelength (296nm) [Dimension: 477mm x 343mm x 285mm (Length x Width x Height)].

### **TLC scanner**

Camag TLC scanner III densitometer operated in reflectance- absorbance mode. The scanning speed was 5-100mm/s. The source of radiation used was deuterium lamp, halogen tungsten and mercury vapour emitting a continuous UV spectra between 190-800nm (with wavelength accuracy  $\pm 1$ nm). Scanner fitted with grating type of monochromator. General operating temperature range is 18-35°C. [Dimension: 620mm x 620mm x 345mm (Width x Length x Height)].

#### **Standard Drugs**

**Marketed Formulations** 

Authentication of Drug

Authentication of Pure Drug Sample of Luliconazole

#### Authentication of Luliconazole

#### **Test procedure for UV**

Accurately weighed quantity (10mg) of Luliconazole was transferred to 10.0ml volumetric flask, added 5ml of methanol and ultrasonicated for 10 minutes, volume was then made up to the mark with methanol (1000µg/ml). From above solution, 1.0ml solution was diluted to 10.0ml with methanol. Further diluted 1.0ml of this solution to 10.0ml with

methanol conc. obtained  $(10\mu g/ml)$ . This solution was then scanned in spectrum mode, from 400nm to 200nm, in 1.0cm cell against methanol as blank.

## Observation

The wavelength of maximum absorbance was found to be 294nm.

### Inference

Luliconazole pure drug sample complies the test.

#### Melting point test

Reported melting point for Luliconazole is  $149 - 154^{\circ}C$ .

#### Observation

Observed melting point for Luliconazole 150 - 152°C.

#### Inference

Luliconazole passes the test.

#### Inference

Observed frequencies of pure drug sample of Luliconazole matches with standard values. Hence Luliconazole pure drug sample complies the test.

#### Method

Development and validation of stability indicating assay method for luliconazole using high performance thin layer chromatography technique

#### **Experimental work**

#### **Chromatographic Procedure**

Chromatography was performed on  $10 \times 10$ cm aluminium TLC plates precoated with 250µm layers of silica gel. Samples were applied in the form of bands, under a continuous flow of nitrogen, by means of a Camag Linomat V sample applicator fitted with 100µL Applicator syringe. A constant application rate of 0.1µL per second was used and the distance between the adjacent bands were also optimized. The plates were then conditioned for 10 min in a presaturated twin-trough glass chamber (10 x 10cm2).

The spotted plate was then dipped in mobile phase (Tolune: Methanol: GAA 8:2:0.2; v/v) and ascending development was performed to a distance of around 80mm from the point of application at ambient temperature. Subsequently after, plates were dried in a current of air with the help of an air dryer and spots was visualized in Camag UV cabinet with dual wavelength UV lamp and Available online: www.uptodateresearchpublication.com densitometric scanning was performed at 296nm with Camag TLC scanner III operated in reflectance-absorbance mode and controlled by WINCATS software.

The slit dimensions  $(4 \times 0.2 \text{mm})$  were also optimized and kept constant throughout the analysis.

# Method development

# **Preparation of standard solutions**

A stock solution of LUL was prepared by dissolving accurately about 10mg of LUL with 100mL methanol. Aliquots of this solution were suitability diluted with methanol to get working standard solutions of LUL having concentration of 1000µg /mL.

#### **Selection of Mobile Phase**

Aliquot portions of standard stock solutions  $(0.4\mu L)$  were applied on TLC plates in the form of band (band size: 6mm). Different solvents with varying polarity as well as combination of solvent were tried to get well separated bands of the drugs. After trying several permutations and combinations, the solvent system containing Tolune: Methanol: GAA the ratio 8:2:0.2v/v/v was found to be most satisfactory as it gave good resolution.

# Selection of wavelength for densitometric evaluation of separated bands

Standard stock solution was applied on TLC plate with the help of CAMAG LINOMAT-V automatic sample applicator, the plate was chromatographed in twin-through glass chamber saturated with mobile phase for 10 minutes. After chromatographic development, the plate was removed and air dried. The separated bands on the TLC plate were scanned over the wavelength range of 200-700nm. The wavelength 294nm was selected for densitometric evaluation of separated bands. The spectrum obtained is depicted in Figure No.11.

#### **Chromatographic conditions**

The following chromatographic conditions were optimized by trial and error for effective separation and densitometric evaluation of drugs:

#### **Densitogram of Luliconazole**

The Retention factor (Rf) of Luliconazole was 0.62.

#### Method validation

To prove the reliability and reproducibility, the developed method was validated for following validation parameters.

# Analysis of bulk drug

#### **Preparation of Standard Solution**

# Five sample solutions were prepared and analyzed in following manner

An accurately weighed quantity of 10mg LUL was transferred to 100mL volumetric flasks dissolved and diluted up to the mark with methanol. From this solution, 10.0mL was transferred to 100.0mL volumetric flask and diluted to the mark with methanol (Concentration 10µg/mL). On TLC plate two bands of standard and four bands of sample solution, 1µL each, were applied and the plate was developed and scanned under the optimized chromatographic conditions. After scanning, the peaks obtained for standard and sample were integrated. .The amount of LUL present in applied volume of standard solution was fed to computer. Amount of the drugs present in applied volume of sample solution was obtained by comparison between peak area of standard and sample bands. The total amount of drug estimated in laboratory mixture and percent estimation was calculated by using following formula.

#### Linearity and range

For establishment of linearity of LUL by proposed method, the calibration curve was obtained at five levels in the concentration range of 100-500ng/spot. For this the different increasing amounts of LUL working standard ( $0.1\mu g/mL$ ) was spotted three times on individual plates and analyzed as described. For evaluation of linearity, observed peak area and concentrations were subjected to least square regression analysis to calculate calibration equation and correlation coefficient. The observed linearity confirming adherence of the system to Beer's law. The regression analysis equation was y = 1888.896+16.547X with correlation coefficient (r) was 0.990.

#### Precision

Precision of the method was verified by repeatability and intermediate precision studies.

Available online: www.uptodateresearchpublication.com

#### Repeatability

In the repeatability studies, six replicates of one concentration of Luliconazole were prepared and spotted on HPTLC plate. From the obtained data, %RSD of Luliconazole were found to be less than 2%. The results of repeatability studies for Luliconazole shown in Table No.9.21.

#### **Intermediate Precision**

In the intermediate precision studies, six replicates of one concentration was prepared and spotted on HPTLC plate for 3 consecutive days. From the obtained data, %RSD of Luliconazole were found to be less than 2%. The intermediate precision results of Luliconazole shown in Table No.9.4.

### Accuracy

To ascertain the accuracy of proposed method, recovery studies were carried out by standard addition method, as per ICH guidelines.

# **Preparation of Sample Solutions**

An accurately weighed quantity of pre-analysed tablet powder equivalent to about 10mg LUL was transferred individually in nine different 100mL volumetric flasks. To each of the flask following quantities of LUL was added.

Then 5mL methanol was added to each flask and contents of the flask were ultrasonicated for 20 minutes, volume was made up to the mark with methanol. The solution was individually mixed and filtered through Whatman filter paper No. 42. From the filtrate, 1.0mL solution was diluted to 10.0mL with methanol.

On TLC plate two bands of standard and four bands of sample solution,  $0.4\mu$ L each, were applied and the plate was developed and scanned under the optimized chromatographic conditions. After scanning, the chromatograms obtained for standard and sample were integrated. The result of accuracy study is given in Table No.22.

The accuracy of the method was determined by calculating the recovery of Luliconazole by the standard addition method at three concentration levels (80%, 100% and 120%). The percentage recoveries of Luliconazole were found to be in the range of 101.67-103.61%. The Accuracy results of Luliconazole shown in Table No.9.5. The weight of the lotion taken is 10mg.

# Range

Range of Luliconazole was found to be as follows Luliconazole: 100-500ng/band

# LOD and LOQ

### Limit of Detection (LOD)

For Luliconazole, LOD was calculated from the formula

 $LOD = 3.3\sigma/S$ 

 $\sigma$  = Standard deviation of the response

S = slope of the calibration curve

Limit of detection of Luliconazole = 15.48 mg/band

## Limit of Quantitation (LOQ)

For Luliconazole, LOQ was calculated from the formula LOQ=10  $\sigma/S$ 

 $\sigma$  = Standard deviation of the response S= slope of the calibration curve

Limit of Quantitation of Luliconazole = 46.92ng/band

### Robustness

To evaluate the robustness of the proposed method, small but deliberate variations in the optimized method parameters such as change in chamber saturation time, change in composition of the mobile phase. This was studied to find out the robustness of the proposed method %RSD was found to be less than 2%. The Robustness result of change in saturation time (±5min) of Luliconazole shown in table.

### Analysis of marketed lotion formulation

Brand Name: Lulifin 10ml Lotion

Label Claim: 1%w/v

The % label claim of Luliconazole lotion was found to be 101.994%.

### **Stress (Forced) Degradation Study**

The stress degradation studies for LUL were carried out as per ICH guidelines. Different stress conditions were applied such as acid, base, hydrolytic, oxidative, dry heat (thermal) and light exposure on LUL bulk drug.

The stress studies were carried out by preparing LUL solution of 1mg/mL in respective stressors as described in Table No.25.

#### Forced degradation study of LUL

10mg LUL was separately transferred to six different 10.0ml volumetric flasks (Flask No. 1, 2,

3, 4, 5 and 6), added 3.0ml of 0.1 N HCl, 0. 1 N Available online: www.uptodateresearchpublication.com

NaOH, H2O to Flask No. 1, 2, 3 respectively. In flask No. 4: 3% H2O2 is added and kept at dark for 3 hr and after that heated to remove H2O2. Flask No. 1, 2, 3 were then refluxed at 80°C for 1 hr. Flask No. 5 containing LUL was kept at 80°C for 3 hrs to study the effect of heat on drug sample (heat The forced degradation degradation). was performed in the dark to exclude the possible degradative effect of light. Flask No.6 was exposed to ultraviolet radiations at 294nm for 24 hrs in a UV-chamber. All the flasks were removed, the LUL samples were treated and analyzed in similar manner as described under analysis of pure drug.

The typical densitogram for acidic, alkaline, oxide, Neutral, heat and UV exposure, are shown in figure respectively.

# FORCE DEGRADATION STUDY OF LICONAZOLE BY HPTLC

#### Acidic stress degradation

In acidic stress degradation, Luliconazole showed 5.17% degradation was observed on exposure to 0.1N HCl at room temp for 20 min. (Figure No.1).

# Alkaline stress degradation

In alkaline stress degradation, Luliconazole showed 7.20% degradation in 0.1N NaOH at room temp for 45 min. (Figure No.2).

# **Oxidative stress degradation**

In oxidative stress degradation, Luliconazole showed 8.18% degradation in 3% H<sub>2</sub>O<sub>2</sub> at room temperature for 45 min. (Figure No.3)

## Photolytic stress degradation

In photolytic stress degradation, Luliconazole showed 5.72% degradation on exposure to UV light (294 nm) for 24 hrs. (Figure No.4).

### **Thermal Stress degradation**

In thermal stress degradation, Luliconazole showed 7.58% degradation on exposed to  $60^{\circ}$ C for 45 min. (Figure No.5).

#### Neutral Stress degradation

In Neutral stress degradation, Luliconazole showed 7.82% degradation in Distilled Water at room temperature for 45 min. (Figure No.6).

#### SUMMARY AND CONCLUSION High Performance Thin Layer Chromatography (HPTLC)

#### Luliconazole

A quick, precise and accurate method based on HPTLC has been developed for analysis of Luliconazole. The method was developed and validated for the determination of Luliconazole on pre coated silica gel HPTLC plates using Toluene: methanol: GAA Solution (8:2:0.2V/V/V) as a mobile phase with Densitometric detection at 294nm. The method was validated for linearity, precision, accuracy and robustness. Linearity range for LUL was found 100-500ng/band Correlation coefficient was 0.990. The developed method was precise and robust, % RSD was found less than 2%. % recovery was found to be in range of 101.67103.61%. LOD and LOQ were 15.48ng/b and 46.92ng/b.

Stress degradation studies were performed to evaluate the stability indicating properties and specificity of the method. Degradation study was carried out by exposing of working standard solution of LUL with acid (0.1N HCL at 800C), base (0.1 N NaOH at 80°C), hydrogen peroxide (3% H2O2), Distilled water (H2O) for 2 hours while one volumetric flask was exposed to UV light (294nm) and one volumetric flask was exposed to (80°C) for 24 hours and thermal LUL sample at (80°C for 1hr) the degradation was found to be resp. (5.17% 7.20%, 8.18%, 7.82%, 7.58%, 5.72%).

# Table No.15: Change in Mobile phase composition (±1ml) of Luliconazole

Nikhil K. Gabhale and Amit S. Tapkir. / Asian Journal of Pharmaceutical Analysis and Medicinal Chemistry. 9(1), 2021, 16-31.

S No	Strong Condition	Temp and Time	Percentlabel claim	Rf Value of degraded	
<b>3.</b> 110	Stress Condition	Luliconazole	Luliconazole	product	
1	Acid (0.1 N HCl)	Room temp for 30 min	5.17%	0.46	
2	Alkali (0.1 N NaOH)	Room temp for 30 min	7.20%	0.44	
3	Oxide (3 % H2O2)	Room temp for 30min	8.18%	0.47	
4	Neutral(H2O)	Room temp for 30 min	7.82%	0.48	
5	Thermal	60°C for 30 min	7.58%	0.48	
6	Photolytic Degradation	24 hr	5.72%	0.46

Figure No.12: HPTLC Densitogram of oxidative degradation of Luliconazole in 3% H2O2 at room temperature after 45min

Figure No.13: HPTLC Densitogram of photolytic degradation of Luliconazole on exposure to UV light for 24 hrs

Figure No.14: HPTLC Densitogram of thermal degradation of Luliconazole on exposure to 60°C for 30 min

Figure No.15: HPTLC Densitogram of Hydrolytic degradation of Luliconazole in Distilled Water at room temperature after 45 min

### CONCLUSION

The proposed HPTLC methods gives well symmetric peaks for Luliconazole. Based on the results obtained it is concluded that these methods are sensitive, accurate, precise and reproducible. The proposed HPTLC methods was also able to selectively quantitate Luliconazole in presence of the degradation product obtained in stability study. ICH guideline were followed throughout method validation and the suggested methods can be applied for routine quality control analysis of pharmaceutical formulation containing Luliconazole.

### ACKNOWLEDGEMENT

The authors express their deep sense of gratitude towards the P. E. Society's, Modern College of Pharmacy, Yamuna Nagar, Nigdi, Pune-411044, Maharashtra, India for providing the necessary infrastructure and facilities to carry out the present research.

### **CONFLICT OF INTEREST**

The authors declare no conflict of interest.
